Name of the Guide		Dr. J. Kavitha Reddy

Abstract

Customer feedback is generated continuously across surveys, support tickets, app reviews, and social media, but most organizations still rely on manual tagging and static rule-based sentiment tools to process it. This slows response times, misses emerging issues, and fails to improve as customer language and concerns evolve. FeedbackFlow AI is proposed as an adaptive customer feedback system that automatically ingests feedback from multiple channels, classifies it by sentiment and topic using natural language processing, and prioritizes issues based on urgency and impact.

Unlike static analysis pipelines, the system is designed to adapt over time: it learns from corrections made by human reviewers and from shifting patterns in incoming feedback, continuously refining its classification and prioritization models. This adaptive software engineering approach allows the system to stay accurate as products, customers, and vocabulary change, without requiring frequent manual retraining or rule updates.

The system provides a real-time dashboard that surfaces trending complaints, sentiment shifts, and high-priority issues to product and support teams, enabling faster and more informed decision-making. By combining automated feedback processing with continuous adaptation, FeedbackFlow AI aims to reduce response latency, improve issue detection accuracy, and give organizations a scalable way to stay responsive to their customers.
